

Migration Type	Value	Notes
Farm Structure	OS Area	
	Official Area	
	Soil Type	Only allows RB209 soil types and this is calculated in NMP based on soil texture and sub soil type
	K release clay	Redundant in new RB209
	Sulphur deficient	Redundant in new RB209
	SPR Soil risk	Will come in with Farm Mapping improvements
	Protection Status	Can be added as a Tag
	Undersown status	Can be added as a Tag
	Predicted yields	Can be added in the cropping record
	Crop residue	Can be added as a Tag
	Crop end use	Can be added as a Tag
Operations	Uncompleted Jobs	
	Costs	Although operations could be migrated the average unit prices on products are driven by stock periods which are user defined but against a season in TELUS Crop Management so prices would have been adjusted and inaccurate
Margins	Margin data in historical years	Margin reports are not available on the imported history due to costs not being included with historic operations.
Stock	Stock quantities	Current instock quantities are not imported. Products that are used in jobs are taken from stock but once we have migrated a season we zero the product quantities rather than leave customers with large negative figures in each previous season migrated.
	Historic stock	Products in migrated operations will appear in that season. However, it's not a full stock history as the quantities are zeroed out at the end of the season to prevent users starting on TELUS Crop Management with negative stock.
